

MASTERS STUDIES IN NEUROSCIENCE AT SORBONNE UNIVERSITÉ

The Master BIP-Neuroscience program trains students in all fields of neuroscience:

- *cellular and molecular neuroscience*
- *integrated neuroscience*
- *cognitive neuroscience*
- *systems and computational neuroscience*
- *behavior*
- *development*
- *vision*
- *neurodegenerative diseases*
- *psychiatric diseases*
- ...

*The program extends over 2 years, with the possibility of joining **directly in the 2nd year** (depending on previous training).*

Our training program is based on:

- more than **38 teaching modules in neuroscience** supported by recognized specialists (researchers, teachers/researchers, clinicians, ...)
- more than **200 research teams**, in France and abroad, regularly involved in our training.
- close collaboration, for teaching and research training, with the **4 Sorbonne Université neuroscience institutes (Neuroscience Paris Seine, Paris Brain Institute, Institut de la Vision, Institut du Fer à Moulin)**, and with the **Institut Pasteur** and the **Ecole Normale Supérieure (ENS)**
- **3 international training programs** in partnership with **University College London, University of Heidelberg, National Autonomous University of Mexico, Indian Institute of Technology Delhi, and Trinity College Dublin**
- **10 months of internship** in internationally-recognized laboratories in France or abroad

The Neurosciences are fundamentally interdisciplinary, and our program is aimed at students from many different backgrounds -- **life sciences, medical training, engineering, mathematicians, computer sciences** -- aiming to pursue a career in neuroscience in the public or private sector.

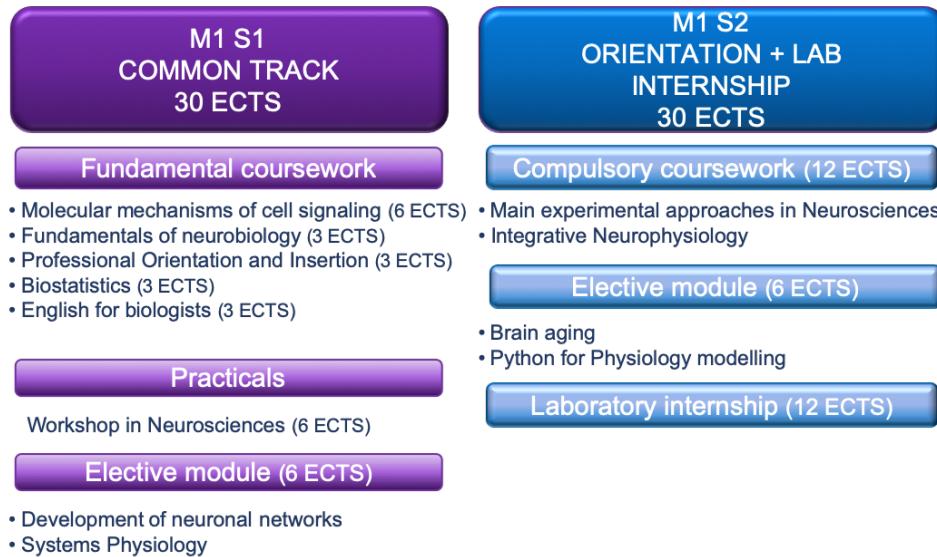

MASTERS STUDIES IN NEUROSCIENCE AT SORBONNE UNIVERSITÉ

Training in the Master BIP – Neuroscience program helps students develop skills that transfer to other professions outside of the neuroscience field:

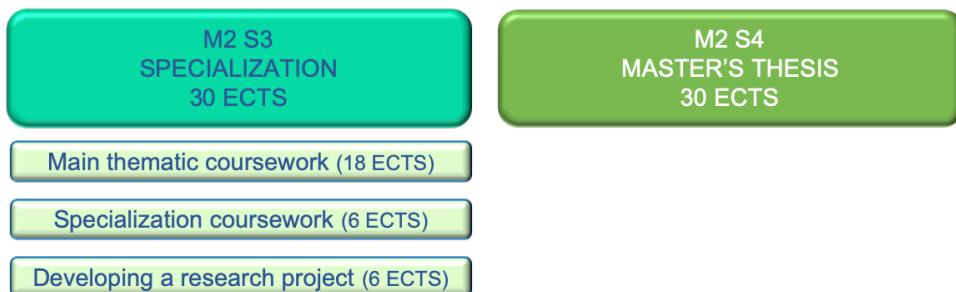

- *Project management*
- *Data management and analysis*
- *Scientific writing*
- *Presentation skills*
- *Entrepreneurship*
- *Developing scientific expertise*
- *Critical reading of the scientific literature*
- *Creativity...*

General organization:

The **first-year program (M1)** provides fundamental coursework with a progressive focusing on neuroscience:

The **second-year program (M2)** is designed to provide a unique opportunity for each student to acquire in depth theoretical and practical knowledge in their field of interest.

MASTERS STUDIES IN NEUROSCIENCE AT SORBONNE UNIVERSITÉ

To help students organizing their training program, **5 thematic tracks** are proposed but courses from different tracks can be selected by each student to build his own personal curriculum:

- *cellular and integrative neuroscience*
- *cognitive and behavioral neuroscience*
- *vision science*
- *neurodegenerative diseases*
- *neurobiology of psychiatric diseases*

Each thematic track is based on suggested fundamental thematic coursework for a total of 18 ECTS.

Details of thematic track coursework:

- *Most thematic coursework is taught in 2-week blocks in November and December (compatible with the schedule of medical interns)*
- *Some limited-enrollment courses (upon application), organized with the Ecole Normale Supérieure (ENS), Institut Pasteur and the Paris Brain Institute (ICM), are taught in September and October.*

Main thematic coursework (18 TO 24 ECTS)			
Cognitive and Behavioral Neurosciences (NCC)			
September Upon application	Block 1	Block 2	Block 3
• ICM course: Brain to Market summer school	• Social brain and emotion	• Neurobiology of psychiatric diseases	• Cerebral bases of cognitive functions
Integrated & Cellular Neurosciences (NCI)			
September Upon application	Block 1	Block 2	Block 3
• ENS/SU course in neurophysiology • Pasteur course, "Development and Plasticity of the Nervous System" • ICM course: Brain to Market summer school	• Development of the nervous system • Cellular communications • Vision from retina to primary visual cortex • Novel technologies applied to human neuropathologies	• Physiology and pathology of neurotransmission and signalization • Sensory and motor physiology and physiopathology • Physiology of perception	• Neuronal networks • Glial pathologies and neurodegenerative diseases • Physiopathology of sensory diseases and translational research • Understanding psychiatric disorders: from signalling molecules to circuit & behaviour
International Master's program in Vision Sciences			
Block 1	Block 2	Block 3	
• Vision from retina to primary visual cortex	• Physiology of perception	• Physiopathology of sensory diseases and translational research	
International Master in Neurodegenerative Diseases (IMND)			
September	Block 1	Block 3	
• ICM course: Brain to Market summer school	• Novel technologies applied to human neuropathologies	• Glial pathologies and neurodegenerative diseases	
Throughout the semester	• Hot topics: transdisciplinary approaches to neurodegenerative and psychiatric diseases		
Neuroscience of psychiatric diseases			
Throughout the semester	Block 1	OR	Block 2
	• Novel technologies applied to human neuropathologies		• Physiology and pathology of neurotransmission and signalization
	• Hot topics: transdisciplinary approaches to neurodegenerative and psychiatric diseases		• Understanding psychiatric disorders: from signalling molecules to circuit & behaviour

MASTERS STUDIES IN NEUROSCIENCE AT SORBONNE UNIVERSITÉ

Details of specialization coursework:

- 2 series of one-week courses are taught in December and January. Each student chooses 1 course in each series.

Specialization coursework (6 ECTS)

Block A
3 ECTS

- Hippocampus/ from cells to physiology and human pathology
- Brain imaging
- Memory and spatial navigation
- Hormonal brain and behavior
- Biophysical modelization in computational neurosciences
- Neuropsychiatry genetics
- Interdisciplinary tutoring in neuroscience 1

Block B
3 ECTS

- Cells, circuits and functions: processing by the cerebellum
- Neuron-glia interactions
- Animal models in behavioural neurosciences: from insects to primates
- Molecular neuropharmacology
- Pharmacological approaches in neurosciences
- Thalamus-cortex rhythms during sleep and absence epilepsy
- Neural bases of olfactory perception
- Interdisciplinary tutoring in neuroscience 2

Developing a research project:

This mandatory course is directly linked to the student's laboratory internship project. With the help of their internship supervisors, students describe, in a short written document and during an oral presentation, the design and feasibility of their experimental plan to answer the scientific question they will address during their lab internship. The developed research project will be undertaken, full-time, during the second semester.

Master's thesis:

- 5 to 6 month internship performed in an internationally renowned research laboratory in France or abroad (financial support is available at the Master and University levels to help student mobility).
- The M2 research project is a professional experience that allows students to acquire scientific and technical expertise in their specialities as well as general skills (ability to carry out a project, to research and analyse information, to work in a team, to display creativity and critical thinking, to present information in a written and/or oral form ...) also valuable in non-research contexts.
- List of projects proposed by French and foreign laboratories regularly participating in our formation is available on our website but students can also submit their application to other research teams that work in their field of interest.
- At the end of the internship a written and oral dissertation is defended in front of a jury in June or September.

International programs:

The Master BIP-Neuroscience has developed close collaborations with prestigious foreign partners (**University College London, Trinity College Dublin, National Autonomous University of Mexico, Indian Institute of Technology Delhi**) to construct 3 international programs.

MASTERS STUDIES IN NEUROSCIENCE AT SORBONNE UNIVERSITÉ

Students interested are encouraged to directly contact people in charge of the programs for further details (for contacts see Management of the Master BIP-Neuroscience)

Dual Master in Brain and Mind Sciences (admission before the M1 year):

- The Dual Master in Brain and Mind sciences is an international 2-years program, offered by **University College London** and **Sorbonne Université**, in **collaboration with the Ecole Normale Supérieure**.
- Students choose from a large number of courses proposed by each of the three prestigious partners.
- The first year is spent in London and the second year in Paris, with a research project to be carried in each city. Students graduate with a **Masters degree from UCL** after completion of the first year, **and** with a **Masters diploma from Sorbonne Université** after completion of the second year.

International Master in Neurodegenerative Diseases (iMIND):

- iMIND, developed in **collaboration with the Institut du Cerveau et de la Moelle Epinière (ICM)**, is focused on **neurodegenerative diseases**.
- iMIND is partnering with the **Trinity College Dublin** and **University of Heidelberg**.
- Master's internships of the first and/or second years can be performed in the institutes affiliated to the program (a list of participating laboratories is available in our website).
- one/ two full semesters of studies in one of our foreign partners can be implemented for students integrating the program in the first year.

International Master in Vision Science

- This program, developed in **collaboration with the Institut de la Vision (IDV)**, is dedicated to the study of **visual function** in humans, animals or computational models.
- It gives opportunities to follow one/two full semesters of study and/or to perform internships in the **Universidad Nacional Autonoma de Mexico (UNAM)**.
- Students validating two semesters in our partner university graduate with a **Master degree from UNAM** and a **Master degree from Sorbonne University**.

Main tracks: NCI and NCC

Cellular and Integrated Neurosciences - NCI

Most courses in English

Upon application

[MU5BIN10 - ENS/SU course in neurophysiology \(12 ECTS\)](#)

Block 1

[MU5BIN02 - Development of the nervous system \(6 ECTS\)](#)

Block 2

[MU5BIN06 - Neurotransmission and Signaling in Health and Disease \(6 ECTS\)](#)

Block 3

[MU5BIN04 - Neuronal networks \(6 ECTS\)](#)

[MU5BIN09 - Pasteur Development and Plasticity of the Nervous System \(12 ECTS\)](#)

[MU5BIN03 - Cellular communications \(6 ECTS\)](#)

[MU5BIN05 - Physiologie et physiopathologie sensorielle et motrice \(6 ECTS\)](#)

[MU5BIN07 - Glial pathologies and neurodegenerative diseases \(6 ECTS\)](#)

[MU5BIN15 - ICM course: Brain to Market summer school \(6 ECTS\)](#)

[MU5BIN1 - Vision from retina to primary visual cortex \(6 ECTS\)](#)

[MU5BIN20 - Physiology of perception \(6 ECTS\)](#)

[MU5BIN21 - Physiopathology of sensory diseases and translational research \(6 ECTS\)](#)

[MU5BIN18 - Novel technologies applied to human neuropathologies \(6 ECTS\)](#)

[MU5BIN25 - Understanding psychiatric disorders: from signalling molecules to circuit & behaviour \(6 ECTS\)](#)

Cognitive and Behavioral Neurosciences - NCC

All courses in French

Upon application

[MU5BIN15 - ICM course: Brain to Market summer school \(6 ECTS\)](#)

Block 1

[MU5BIN11 - Cerveau social et émotion \(6 ECTS\)](#)

Block 2

[MU5BIN13 - Neurobiologie des troubles psychiatriques \(6 ECTS\)](#)

Block 3

[MU5BIN12 - Bases cérébrales des fonctions cognitives \(6 ECTS\)](#)

- Most thematic coursework is taught in 2-week blocks in November and December (compatible with the schedule of medical interns).
- The limited-enrollment course (upon application), organized with the Institut du Cerveau (ICM, Paris Brain Institute), is taught in September.

Tracks with specific themes (all courses in English)

Neurodegenerative Diseases - iMIND

International

Upon application

[MU5BIN15 - ICM course: Brain to Market summer school \(6 ECTS\)](#)

Throughout the semester

Block1

[MU5BIN18 - Novel technologies applied to human neuropathologies \(6 ECTS\)](#)

[MU5BIN22 - Hot topics: transdisciplinary approaches to neurodegenerative and psychiatric diseases \(6 ECTS\)](#)

Block 3

[MU5BIN07 - Glial pathologies and neurodegenerative diseases \(6 ECTS\)](#)

- Most thematic coursework is taught in 2-week blocks in November and December (compatible with the schedule of medical interns).
- The limited-enrollment course (upon application), organized with the Institut du Cerveau (ICM, Paris Brain Institute), is taught in September.

Neuroscience of Psychiatric Diseases - NMP

Block 1

[MU5BIN18 - Novel technologies applied to human neuropathologies \(6 ECTS\)](#)

Block 2

[MU5BIN06 - Physiological and pathological neurotransmission and signalisation \(6 ECTS\)](#)

Block 3

[MU5BIN25 - Understanding psychiatric disorders: from signalling molecules to circuit & behaviour \(6 ECTS\)](#)

Throughout the semester

[MU5BIN22 - Hot topics: transdisciplinary approaches to neurodegenerative and psychiatric diseases \(6 ECTS\)](#)

- Most thematic coursework is taught in 2-week blocks in November and December (compatible with the schedule of medical interns).

Vision Sciences - iMOV

International

Block 1

[MU5BINV1 - Vision from retina to primary visual cortex \(6 ECTS\)](#)

Block 2

[MU5BIN20 - Physiology of perception \(6 ECTS\)](#)

Block 3

[MU5BIN21 - Physiopathology of sensory diseases and translational research \(6 ECTS\)](#)

- Thematic coursework are taught in 2-week blocks in November and December (compatible with the schedule of medical interns).

December courses - MU5BIN16

Enrolling in the Tutorat of the nervous system(6 ECTS) replaces any module of **MU5BIN16** and **MU5BIN17**

MU5BIN16 : 7 modules (3 ECTS each) and the tutorat (6 ECTS)

You must choose one module among the list below.

Upon application, some students can replace the modules of both December and January by the **tutorat of the nervous system**, running throughout the semester or by the Hot Topics for the PIM iMIND students).

- [MU5BIN16 Modèles animaux en neurosciences comportementales : de l'insecte aux primates](#)
- [MU5BIN16 Cells, Circuits and Functions How multimodal information processing of the Cerebellum influences behavior \(anglais\)](#)
- [MU5BIN16 Cerveau hormonal et comportements](#)
- [MU5BIN16 Hippocampus: from cells to physiology and human pathology \(anglais\)](#)
- [MU5BIN16 Imagerie cérébrale](#)
- [MU5BIN16 New methods for behavioral & cognitive explorations: Applications to neurodegenerative diseases \(anglais\)](#)
- [MU5BIN16 Olfaction: approches multidisciplinaires en neurosciences](#)

December courses - MU5BIN17

Enrolling in the Tutorat of the nervous system(6 ECTS) replaces any module of **MU5BIN17** and **MU5BIN16**

MU5BIN17 :6 modules (3 ECTS each) and the tutorat (6 ECTS)

You must choose one module among the list below.

Upon application, some students can replace the modules of both December and January by the **tutorat of the nervous system**, running throughout the semester or by the Hot Topics for the PIM iMIND students).

- [MU5BIN17 Mémoire et navigation spatiale](#)
- [MU5BIN17 Neuron-Glia Interactions \(anglais\)](#)
- [MU5BIN17 Neuropsychiatry genetics \(anglais\)](#)
- [MU5BIN17 Pharmacological approaches in neurosciences \(anglais\)](#)
- [MU5BIN17 Rythmes thalamo-corticaux du sommeil et de l'épilepsie-absence](#)
- [MU5BIN17 Modélisation Biophysique en neurosciences computationnelles](#)

Teaching Units in English

(see also «Restricted enrollment Teaching Units »)

- MU5BIN02 Development of the Nervous System
- MU5BIN03 Cellular Communications
- MU5BIN04 Neuronal Networks
- MU5BIN06 Neurotransmission and Signalling in Health and Disease
- MU5BIN07 Glial Pathologies and neurodegenerative diseases
- MU5BIN18 Novel technologies applied to human neuropathologies
- MU5BINV1 Vision from retina to primary visual cortex
- MU5BIN20 Neurophysiology of perception
- MU5BIN21 Physiopathology of sensory diseases and translationnal research
- MU5BIN25 Understanding psychiatric disorders: from signalling molecules to circuit & behaviour

- MU5BIN16 Ouverture thématique 1– some module options
- MU5BIN17 Ouverture thématique 2 – some module options

This module will introduce students to the main events during the development of the nervous system, as well as the experimental model organisms used to study these events.

Researchers working directly in the field provide the lectures, using primary scientific literature to illustrate the different topics. Cellular and molecular interactions are presented, as well as the resulting mature neuronal networks.

Topics presented :

- Introduction to early neural development
- Brain Regionalization
- Neuronal Migration
- Transcriptional control of neuronal specification
- Cortical development and epilepsy
- Neuronal and Glial Specification,
- Neurogenesis
- Axon guidance
- Wiring the zebrafish,
- Stem cells (ES and iPS)
- Axonal Regeneration
- Synaptogenesis and synaptic elimination
- Development and plasticity of the visual system,
- Adult Neurogenesis,

Prerequisites:

Prior academic studies in Biology, Medicine, or Neurosciences, at the M1 level.

Learning goals:

- Apply previous knowledge in biology and physiology to nervous system development.
- Understanding basic cellular interactions and molecular signalling events involved in nervous system development
- Understanding the main technical approaches, and conceptual tools, used to study and interpret these events
- Critical analysis of scientific literature in the field of nervous system development.
- Understanding experimental planning and necessary controls
- Evaluating validity of different scientific approaches

Practical information:

6 ECTS

Grading:

- Oral presentation : 50/100
- Written exam : 50/100

Course hours: 34h lectures

Course coordinators:

Dr Richard Belvindrah (richard.belvindrah@sorbonne-universite.fr)

Dr Alexandra Rebsam (alexandra.rebsam@inserm.fr)

16h		PAUSE Salle 14.15.105			
17h		Wiring the zebrafish Jamilé Hazan (16-18h)			
18h					

Student presentations

The nervous system of vertebrates has developed many specific mechanisms for generating and processing information. This UE presents in detail a few selected examples to illustrate a large part of cellular communication processes. It thus covers aspects of signal integration from the molecular to the cellular and neural network levels.

Transporters - SNARE proteins - Operation of excitatory synapses - Operation of inhibitory synapses - LTD in Purkinje cells - Plasticity of inhibitory synapses - The dynamic synapse – Metabotropic receptors and synapses - Synaptic integration - Dynamics of second intracellular messengers and modulation of neuronal properties - Glial cells and neuron-glia interactions - The glycinergic system - Roles of calcium channels in pain pathophysiology – Functional plasticity in the spinal nociceptive system - Introduction to the theory of encoding/decoding information at the neuronal level ...

Prerequisites:

Prior academic studies in Biology, Medicine, or Neurosciences, at the M1 level.

Learning goals:

- Gain the most recent knowledge in neuronal communication.
- Acquire the methodological procedures to answer a specific scientific issue.
- Develop critical thinking regarding an experimental design, results and literature.
- Develop analysis and synthesis skills.

Practical information:

6 ECTS

Grading:

- Written exam : 100/100

Course hours: 28h lectures

MU5BIN04 Neuronal Networks– Bloc 3

This module is about information processing mediated by neural networks. It focuses on the mechanisms underlying multisensory integration, neural coding, and memory formation/retrieval. It presents the multidisciplinary approaches set forth to investigate those topics, by illustrating the most recent developments in both experimental and theoretical research.

The module is organized around a series of lectures and workshops, dealing with the neuronal mechanisms involved in the representation and storage of information. The emphasis is on the mechanisms mediating multi-scale adaptation of neuronal representations of the external world and the encoding of short- and long-term memories. Another key aspect concerns the general nature of the solutions implemented by the brain to optimize the action-perception loop.

Prerequisites:

Basic knowledge about neuronal excitability

Learning goals:

The conceptual and methodological knowledge provided by courses is centred on integrative neurobiology. This module aims at showing the importance of combining experimental approaches (e.g., electrophysiology, behaviour, neuroimaging) and computational approaches (e.g., mathematical neuroscience, numerical simulations) for the study of neural network dynamics and their roles in the coding of information.

Practical information:

6 ECTS

Grading:

- Written exam : 100/100

Course hours: 28h lectures

MU5BIN06 Neurotransmission and Signalling in Health and Disease— Bloc 2

This UE aims at providing a global vision of the signaling of different neuromodulators and neurotransmitters: 1) by presenting receptors (mainly, but not exclusively, GPCRs) and their signaling, as well as evolutionary aspects of signaling ; 2) by exploring cellular functions which can impact on signaling (trafficking, transport across membranes, kinases and phosphatases, structure-function relationship...), 3) by showing signaling alterations in pathologies. The speakers have been chosen to also show the diversity of experimental approaches in neuroscience. This is complemented by student presentations (which all of them must attend) of recent articles each illustrating a specific innovative technique.

Topics addressed : Signaling (dopamine, endocannabinoids, acetylcholine, serotonin, GABA...); transporters ; structure/function of receptors; trafficking and diffusion of receptors ; regulation of transcription ; glia and signaling ; evolution of GPCR and of their coupling; proteomic and transcriptomic approaches. Pathologies: Parkinson, Huntington, bipolar disorders, depression, addiction...

Prerequisites:

Background in cell biology, interest for intracellular signaling, and for approaches at the cellular and molecular level.

Learning goals:

- Seminars → become familiar with concepts and techniques necessary for the experimental practice of neurobiology
- Article presentations → make an oral presentation, provide an update on a technique, be didactic (cf article presentation in groups of 2 or 3)
- Critical analysis of scientific literature (seminars, oral presentation)

Practical information:

6 ECTS

Grading:

- Oral presentation : 50/100
- Written exam : 50/100

Course hours: 40h lectures

Course coordinators:

Anne Roumier (anne.roumier-dauteloup@sorbonne-universite.fr)
Jean-Antoine Girault (Jean-antoine.girault@inserm.fr)

MU5BIN06 Neurotransmission and Signalling in Health and Disease— Bloc 2

1st week:						
	Morning				Afternoon	
Mon. Nov 13 :				13h15-14h00	Introduction on Neurotransmission and Signaling - JAG/AR	14h30-16h30
Tue. Nov 14 :	10h-12h	<i>time for the preparation of oral presentations</i>		13h30-15h30	JA Girault – Protein phosphorylation and intracellular signaling	16h-18h
Wed. Nov 15 :	10h-12h	<i>time for the preparation of oral presentations</i>		13h30-15h30	JP Pin - Dimerisation of GPCRs	16h-18h
Thu. Nov 16 :		<i>time for the preparation of oral presentations</i>		13h30-15h30	S. Jamain – Genetics of psychiatric disorders	16h-18h
Fri. Nov 17 :	10h-12h	L. Maroteaux - Serotonin signaling, Addiction and Depression		13h30-15h30	JA. Girault – Physiology and Pathology of Dopamine signaling	16h-18h
						<i>time for the preparation of oral presentations</i>

2nd week:						
	Morning				Afternoon	
Mon. Nov 20 :		<i>time for the preparation of oral presentations</i>		13h30-15h30	P. Marin – Neuroproteomics	16h-18h
Tue. Nov 21 :	10h-12h	<i>time for the preparation of oral presentations</i>		13h30-15h30	S. Humbert – Huntington's disease	16h-18h

MU5BIN07 Glial Pathologies and Neurodegenerative Diseases– Bloc 3

The goal of this course is to provide an understanding of the mechanisms of neurodegenerative diseases such as Alzheimer's, Parkinson's, and Huntington's disease as well as insight into neuronal cell death, genetics and existing treatments. This course will also focus on the various physiological roles that different glial cells play and the pathologies that are associated with them.

Prerequisites:

A master 1 level in neurosciences or equivalent is required.

Learning goals:

- ✓ Understand some of the techniques for developing new treatments for neurodegenerative pathologies
- ✓ Gain information on different types of glial cells and their functioning
- ✓ Understand the physiopathology involved in diseases related to glial cells (for example multiple sclerosis, peripheral neuropathy, glial tumours)
- ✓ Understand some of the therapeutic strategies for treating glial cell-related disorders
- ✓ Learn how to critically analyse neuroscience literature

Practical information:

6 ECTS

Grading:

- Written exam : 100/100

Course hours: 40h lectures

Course coordinators:

Jean-Christophe Corvol (jean-christophe.corvol@aphp.fr)

Ahmed Idbaih (ahmed.idbaih@aphp.fr)

MU5BINV1 Vision, from retina to primary visual cortex— Bloc 1

The purpose of this course is to introduce the different approaches used to study the early visual system, with a focus on development, physiology and modeling from the retina to the primary visual cortex.

Eminent specialist will introduce the students to their research thematic, among which: eye anatomy, phototransduction, development of the early visual system, functional organization of retinal circuit and retinal signaling, physiology and computational modeling of information processing in the early visual system.

This course will also put a particular emphasis on the state-of-the-art tools used to study neural circuits (multi-electrode recordings, spike sorting, multiphotonic imaging and light shaping).

Prerequisites:

Basic knowledge in Neurosciences

Learning goals:

Students will learn about different experimental techniques, as well as computational tools, and how they can be used and combined to study how the visual system process and extract the information contained in the visual scene.

This course will provide the essential knowledge about the early visual system. It will emphasize the diversity of tools, concepts and technologies used for its study. Most of these tools are also relevant to study other neural circuits. As such, the content presented during this course will also be useful for students interested in other parts of the brain.

Practical information:

6 ECTS

Grading:

- 1 oral presentation (50% of the mark)
- 1 written exam (50% of the mark)

Course hours: 30h lectures

Course coordinators:

Dr Grégory Gauvain (gregory.gauvain@sorbonne-universite.fr)

Dr Gaël Orieux (gael.orieux@sorbonne-universite.fr)

MU5BINV1 Vision, from retina to primary visual cortex— Bloc 1

- Schedule to come

The aim of this course is to present the latest results and current issues related to how sensory cortices process information, and how this gives rises to perception. The emphasis will be on vision, although other modalities will also be discussed. The variety of approaches used to tackle these issues will be presented, ranging from the study of cortical circuits with state of the art tools, to the more integrated level of human psychophysics and animal behaviors.

Different research thematic will be covered: functional exploration of the visual cortex and its plasticity, interaction between visual cortex and other cognitive areas, neuropsychological correlates of perception, cross modal interaction between different sensory modalities, relations between cortical activity and perception such as object, face or space perception, and visual psychophysics.

Prerequisites:

Basic knowledge in Neurosciences

Learning goals:

Students will learn how the visual system is organized and processes information, the prominent role of cortical integration in behavior initiation will be explored, especially the role of attention in decision making. Emphasis will be given on state of the art imaging technique as well as exploration of visual behavior, their use in the study of visual system processing, and the concepts and tools that can be used to bridge the gap between neural activity and perception.

Practical information:

6 ECTS

Grading:

- 1 oral presentation (50% of the mark)
- 1 written exam (50% of the mark)

Course hours: 30h lectures

MU5BIN21 Physiopathology of Sensory Diseases and Translational research– Bloc 3

This course aim at giving an overview of the different pathological context leading to sensory defect. The physiological conditions of the diseases will be explored with an emphasis on how research advances can lead to therapeutic progress.

Neuropathology of the various diseases affecting vision will be addressed: age related macular degeneration, retinitis pigmentosa, dystrophies and other retinal diseases, glaucoma, corneal diseases, usher syndrome, aging. New therapeutic avenues will be considered: cell therapy, gene therapy, implants, medical device. Finally handicap evaluation and rehabilitation techniques will be addressed.

Prerequisites:

Basic knowledge in Neurosciences

Learning goals:

Thanks to the involvement of contributors from academic research, clinical medicine or the industry, participants will gain an understanding in the translational process underlining transition from fundamental research to the development of therapeutic advances. Furthermore, this course is particularly suited for students that wish to acquire knowledge on the specific challenges that bring forth the physiopathology of sensory diseases.

Practical information:

6 ECTS

The main goal of this course is to provide an overview of current approaches and methodologies to study the neurobiological bases of psychiatric diseases. Experts in this field will comprehensively present preclinical models used to identify cellular and molecular events underlying behavioral alterations that are reminiscent to psychiatric diseases in human. They will also describe a panel of up-to-date strategies to design brain-region- and cell-type-specific tools to progress in the understanding of psychiatric disorders and eventually overcome disease-related dysfunctions.

Prerequisites:

Knowledge of basic neurophysiology.

Learning goals:

Attending to this course will provide to students a solid background on cutting-edge approaches to dynamically study and/or manipulate neuronal circuits that are altered in a vast panel of psychiatric disorders. It will put forward the concept that studying the neurobiological correlates of psychiatric diseases is crucial, not only for a better understanding of the brain's (dys)functions, but also for the development of innovative strategies with a potential therapeutic value.

Practical information:

6 ECTS

Mardi 14 Novembre 2023: Salle 505 (bât 105)

14h00-15h30	R JARDRI
15h45-17h15	A VALERO CABRE

Modèles Computationnels en psychiatrie
Bases physiologiques et principes opérationnels de la stimulation cérébrale non invasive (TMS, tdcS) en neuropsychiatrie

Mercredi 15 Novembre 2023 : Salle 511 (bât 91)

9H30-11H00	D DAVID
11H-13H	A C PETIT
14h-15h30	N. JAAFARI
17H-18H	H SOKOL

Neurogénèse et pathologies Psychiatriques
Ketamine et neuroinflammation
Approche neurocognitive des troubles obsessionnels compulsifs
Modèles animaux en psychiatrie
Microbiote et Métabolisme du tryptophane

Jeudi 16 Novembre 2023 : Salle 514 (bât 105)

11h15-12h45	F VINCKIER
14h00-15h30	LIANE SCHMIDT

Motivation et Pathologies Psychiatriques
Mécanismes de l'effet placebo

Vendredi 17 Novembre 2023: Salle 511 (bât 91)

9H30-11H00	S BOURET
11H00-12H30	P.A GEOFFROY
14h00-15h30	A DEL CUL
15h30-17h30	F THIBAUT

Modèles Animaux en Psychiatrie
Sommeil et troubles de l'humeur
Neurosciences cognitives de l'hypnose et des états méditatifs
Génétique de la Schizophrénie

Lundi 20 Novembre 2023 : SALLE 505 (bât 105)

9h30-11h	F VORSPAN
14h00-16h00	A GUESDON
16H00-17h30	L. HUGUEVILLE

Neurobiologie des troubles addictifs
Mind-Wandering
Bases physiologiques de la neuro-imagerie cognitive

Mardi 21 Novembre 2023: SALLE 112 (bât 105)

11h15-12h45	A CACHIA
14H-15H30	S MOUCHABAC

Imagerie Cérébrale de la Schizophrénie
Approches Dimensionnelles en psychiatrie

Mercredi 22 Novembre 2023 : SALLE 219 (bât 91)

9H-11h	P FOSSATI
14h00-16h00	H BOTTEMANNE

Imagerie cérébrale des troubles de l'humeur
Croyance et troubles de l'humeur

Jeudi 23 novembre 2023 : SALLE 514 (bât 105)

11H-12H30 PH DOMENECH

Neuromodulation invasive en psychiatrie :TOC et dépression résistante

Vendredi 24 novembre 2023 : SALLE 511 (bât 91)

11h00-12h30	C GALERA
-------------	----------

Vulnérabilité aux troubles anxieux et au TDAH
Méthodes de génétique épidémiologique

Restricted enrollment Teaching Units (in English)

- MU5BIN09 Pasteur course: Development and Plasticity of the Nervous System
- MU5BIN10 ENS-Sorbonne course in Neurophysiology
- MU5BIN22 Hot topics: Transdisciplinary Approaches to neurodegenerative and Psychiatric Diseases
- MU5BIN18 Novel technologies applied to human neuropathologies
- MU5BIN15 *Brain to Market Summer School – **description to come***

MU5BIN09 Pasteur Course: Development and Plasticity of the Nervous System – mid-September/mid-October

The course Development and plasticity of the nervous system (DPSN) covers the main cutting-edge topics of neuroscience research, at both theoretical and experimental levels. Students following the course will acquire a broad understanding of various topics ranging from molecules to behavior. Various animal models (mouse, frog and drosophila) commonly used in neuroscience research are used, giving students the opportunity to understand the difference between each model, and to further expand their repertoire of practical skills in carrying out experiments. International scientists, expert in their own field of research, provide theoretical and/or experimental courses. During the practical course, students will approach and test stem cell biology, behavioral analyses in mice, drug stereotaxic injection, neuroanatomy and gene expression analyses using histochemical techniques, which are further described below.

Evolution and Development of the Nervous System (2 weeks)

Development, Plasticity, and Pathologies of the Nervous System (2 weeks)

Prerequisites:

Knowledge of basic neurobiology.

Learning goals:

Practical information:

12 ECTS

Evaluation

Oral examination, practical course examination, and a Written examination

Hours

5 weeks, full time

Course coordinators:

Pr Alain Trembleau (alain.trembleau@sorbonne-universite.fr)

Dr Pierre-Marie Lledo (pierre-marie.lledo@pasteur.fr)

Neurons are excitable cells that "express" themselves mainly through electrical signals. These signals (membrane potential changes, current flow through ion channels ...) take place on a very fast time scale, of the order of milliseconds. The nature and speed of these signals impose strong constraints on experimental approaches for studying the physiology of neurons. The two disciplines best adapted to the requirements of Neurophysiology are electrophysiology and cellular imaging techniques.

This course aims to provide a complete theoretical and practical grounding in the electronic techniques underlying modern research in Neurophysiology. During the course, students will use existing experimental facilities at the ENS and UPMC but they will also assemble for themselves experimental setups adapted to the different planned experiments.

Methods in electrophysiology - introduction to numerical methods – Optogenetics - Linking neuronal activity to behavior - Setting up an electrophysiology rig - Analog and digital electronics for electrophysiologists - Optical path of a microscope - Patch-clamp experiments in slices - In vivo neurophysiology - Analyzing electrophysiological data

Prerequisites:

Knowledge of basic neurophysiology.

Learning goals:

- Develop experimental protocols.
- Make a synthetic presentation.
- Conduct bibliographic research.
- Critically analyze the scientific literature.
- Design a research project.
- Acquire the theoretical skills necessary to understand the concepts useful to the experimental practice of biology.
- Write experimental protocols.
- Mobilize in-depth knowledge in integrative biology.
- Design an experimental approach and then develop it in the form of a feasible project.
- Evaluate the validity and limits of the tools and methods used.
- Evaluate the validity of scientific results. Analyze and criticize experimental results.
- Master scientific and technical English in the field of the specialty

Practical information:

12 ECTS

Evaluation

- 1 written report and oral presentation (50% of the grade)
- 1 final written exam (50% of the grade)

Hours

120 hours, lectures and practical work

Course coordinators:

Pr Régis Lambert (regis.lambert@sorbonne-universite.fr)

Dr Mariano Casado (mariano.casado@bio.ens.psl.eu)

MU5BIN22 Hot Topic: Transdisciplinary Approaches to Neurodegenerative and Psychiatric Diseases

Neurodegenerative and psychiatric diseases are a major challenge for the health sector and will only become increasingly so. To tackle the complexity of these diseases, scientists need to have an interdisciplinary approach and the broadest possible points of view.

In this module, to get an appreciation for the multidisciplinary aspect of research in the field of neurodegenerative and psychiatric diseases, **students will develop a research project through analysis of scientific articles under the supervision of an expert tutor in the field, a cross between a research and bibliographic project**. Topics of the projects will cover the latest advances in neuroscience, specifically regarding neurodegenerative pathologies and/or psychiatric diseases, as well as cutting-edge technologies.

In parallel, students will be exposed to notions of fundamental, translational and clinical research by **attending conferences at the Paris Brain Institute, Neuroscience Paris Seine Institute and the Fer à Moulin Institute**, where they will participate in discussions with the international scientists presenting.

Prerequisites:

A master 1 level in biology/neurosciences or equivalent is required.

Learning goals:

- ✓ Critically analyse the scientific literature
- ✓ Master approaches and tools to study neurodegenerative and psychiatric diseases
- ✓ Evaluate the validity of these approaches and tools
- ✓ Suggest experimental approaches to answer scientific issues
- ✓ Elaborate and organise the interpretation of research data
- ✓ Present in a clear summarized manner

Practical information:

6 ECTS

Evaluation

- 1 oral presentation at the end of the first semester (80% of the mark)
- Written reports of minimum 5 conferences (20% of the mark)

Hours and commitment

Personal work throughout the first semester. At least 4 meetings with the tutor is required.

Course coordinators:

Dr. Hélène Cheval (helene.cheval@sorbonne-universite.fr)

Dr. Richard Belvindrah (richard.belvindrah@sorbonne-universite.fr)

Schedule: meetings and seminars throughout the semester- see course coordinators

MU5BIN18 Novel Technologies applied to human neuropathologies– **Bloc 1**

This course provides an overview of cutting edge methodological approaches used to study in an integrative way the molecular and cellular mechanisms associated with neuronal functions and dysfunctions. Four main technological domains will be tackled:

- 1) Omics (transcriptomics, epigenomics, proteomics)
- 2) Stem cell research (iPS cells, 2D and 3D cultures, neuronal differentiation)
- 3) Imaging (multiscale; 2D; 3D with the clearing technique, electron microscopy)
- 4) Electrophysiology (*in vivo*, *in vitro*, Multielectrode Array)

The course addresses the advances in research on **diverse brain disorders** including Parkinson's disease, ALS, Alzheimer's disease, MS, cancer, neurodevelopmental and psychiatric disorders, achieved thanks to such technologies.

The programme includes:

- Theoretical lectures describing the main techniques addressed in this course.
- Technical demonstrations at the cutting-edge technological core facilities of the Paris Brain Institute.
- Talks from expert scientists covering their latest research on neurodegenerative diseases (Parkinson's Disease, Alzheimer's Disease, ALS, MS), as well as other human pathologies (neurodevelopmental diseases, epilepsy, addiction, cancer).
- Talks from junior scientists discussing their research projects as well as their professional experience and training.
- Workshop on ethical considerations related to these new methodological approaches.

Prerequisites:

A master 1 level in neurosciences or equivalent is required. It is mandatory to follow the electrophysiology refresher lecture from Pr Stéphane Charpier in October.

Learning goals:

- ✓ Understand the most recent approaches to study cellular and molecular mechanisms underlying human diseases,
- ✓ Gain knowledge on the scientific advances in these fields,
- ✓ Acquire the methodological understanding (advantages and drawbacks of different approaches) to answer a specific scientific issue,
- ✓ Develop critical thinking about experimental design, results and literature,
- ✓ Develop analysis and synthesis skills.

Practical information:

6 ECTS

Grading:

- 1 oral presentation (analysis of a scientific article ; 30% of the mark)
- 1 written exam (70% of the mark)

Course hours: 40h lectures, round tables, demonstrations

Course coordinators:

Dr Hélène Cheval (helene.cheval@sorbonne-universite.fr)
Dr Charlotte Deleuze (charlotte.deleuze@icm-institute.org)
